

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

MISCELLANEOUS.

172. Proposed by W. J. GREENSTREET, M. A., Editor of The Mathematical Gazette, Stroud, England.

If ϕ and ψ are small angles, show that an approximate value of ϕ/ψ is

$$\frac{2}{3} \frac{\sin \phi}{\sin \psi} + \frac{1}{3} \frac{\tan \phi}{\tan \psi} - \frac{1}{180} (\phi^2 - \psi^2) (9\phi^2 - \psi^2).$$

Solution by G. W. GREENWOOD, Dunbar, Pa.

$$A = \frac{\sin \phi}{\sin \psi} = \frac{\phi}{\psi} \left(1 - \frac{\phi^2}{6} + \frac{\psi^2}{6} + \frac{\phi^4}{120} - \frac{\phi^2 \psi^2}{36} + \frac{7\psi^4}{360} \dots \right)$$

$$B = \frac{\cos \phi}{\cos \psi} = 1 + \frac{\phi^2}{2} - \frac{\psi^2}{2} + \frac{5\phi^4}{24} - \frac{\phi^2 \psi^2}{4} + \frac{\psi^4}{24} \dots$$

$$\frac{\tan \phi}{\tan \psi} = AB = \frac{\phi}{\psi} \left(1 + \frac{\phi^2}{3} - \frac{\psi^2}{3} + \frac{2\phi^4}{15} - \frac{\phi^2 \psi^2}{9} - \frac{\psi^4}{45} \dots \right)$$

$$\therefore \frac{2}{3} \frac{\sin \phi}{\sin \psi} + \frac{1}{3} \frac{\tan \phi}{\tan \psi} = \frac{\phi}{\psi} \left(1 + \frac{\phi^4}{20} - \frac{\phi^2 \psi^2}{18} + \frac{\psi^4}{180} \dots \right)$$

$$= \frac{\phi}{\psi} \left[1 + \frac{1}{180} (\phi^2 - \psi^2) (9\phi^2 - \psi^2) \right].$$

The problem does not appear correct.

Solved in a similar way and with the same result by G. B. M. Zerr.

PROBLEMS FOR SOLUTION.

ALGEBRA.

301. Proposed by G. B. M. ZERR, A. M., Ph. D., 4243 Girard Avenue, Philadelphia, Pa.

A is at Philadelphia, B at Chicago. A's personal equation is e ; B's is E . When a star crosses A's meridian at time $t_1=8$ hours, 33 minutes, 24 seconds, he presses a button, telegraphing the fact to B, who receives it at time $t_2=7$ hours, 43 minutes, 23 seconds. When it crosses B's meridian at time $T_2=8$ hours, 33 minutes, 10 seconds, he telegraphs A, who receives it at time $T_1=9$ hours, 23 minutes, 11 seconds. They now exchange places, and on the second day following, B observes the transit at time $t'_1=8$ hours, 33 minutes, 26 seconds, and A gets the information at Chicago at time $t'_2=7$ hours, 43 minutes, 25 seconds. It crosses A's meridian at time $T'_2=8$ hours, 33 minutes, 12 seconds, and B gets the information at time $T'_1=9$ hours, 23 minutes, 13 seconds. Find the difference of longitude between Philadelphia and Chicago.
